Multi-linear Algebra – Tucker Decomposition – Lecture 16

F. M. Faulstich

22/03/2024

Recap

## Recap

- Tensors: high-dimensional object
- Tensor diagrams: graphical representation of tensor operations
- Tensor decomposition CP decomposition low-rank approximation
  - $\rightarrow$  tensor rank?

## CP decomposition Format Pros:

# CP decomposition Format

Pros:

- Provides a notion of tensor rank CP-rank
- Very good compression
- Reduction of tensor algebra

Cons:

CP decomposition Format

Pros:

- Provides a notion of tensor rank CP-rank
- Very good compression
- Reduction of tensor algebra

Cons:

• Hard to find

 $\rightarrow$  No systematic way to compute a CP decomposition

• Difficult tensor sets:

$$\mathcal{M}_r = \left\{ \mathbf{X} \in \mathbb{R}^{n_1 \times \dots \times n_d} \mid \text{ CP-rank}(\mathbf{X}) = r \right\}$$

and

$$\mathcal{M}_{\leq r} = \left\{ \mathbf{X} \in \mathbb{R}^{n_1 \times \dots \times n_d} \mid \text{ CP-rank}(\mathbf{X}) \leq r \right\}$$

are not closed.

 $\rightarrow$  Not easy to optimize on.

Λ

Recall the rank characterization:

" r is the smallest number, such that there exist r-dimensional subspaces  $V \subseteq \mathbb{R}^m$  and  $U \subseteq \mathbb{R}^n$ , such that **A** is an element of the induced tensor space  $V \otimes U \subseteq \mathbb{R}^{m \times n}$  "

Recall the rank characterization:

" r is the smallest number, such that there exist r-dimensional subspaces  $V \subseteq \mathbb{R}^m$  and  $U \subseteq \mathbb{R}^n$ , such that **A** is an element of the induced tensor space  $V \otimes U \subseteq \mathbb{R}^{m \times n}$  "

What does this mean? Let  $\{\mathbf{u}_i\}$  and  $\{\mathbf{v}_i\}$  be bases of U and V, respectively.

Recall the rank characterization:

" r is the smallest number, such that there exist r-dimensional subspaces  $V \subseteq \mathbb{R}^m$  and  $U \subseteq \mathbb{R}^n$ , such that **A** is an element of the induced tensor space  $V \otimes U \subseteq \mathbb{R}^{m \times n}$  "

What does this mean? Let  $\{\mathbf{u}_i\}$  and  $\{\mathbf{v}_i\}$  be bases of U and V, respectively. Then

$$\mathbf{A} = \sum_{i=1}^r \sigma_i \mathbf{u}_i \otimes \bar{\mathbf{v}}_i$$

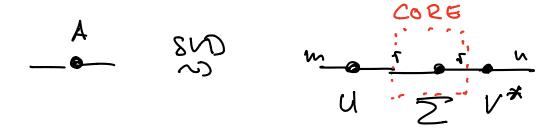

Recall the rank characterization:

" r is the smallest number, such that there exist r-dimensional subspaces  $V \subseteq \mathbb{R}^m$  and  $U \subseteq \mathbb{R}^n$ , such that **A** is an element of the induced tensor space  $V \otimes U \subseteq \mathbb{R}^{m \times n}$  "

What does this mean? Let  $\{\mathbf{u}_i\}$  and  $\{\mathbf{v}_i\}$  be bases of U and V, respectively. Then  $\mathbf{A} = \sum_{i=1}^r \sigma_i \mathbf{u}_i \otimes \bar{\mathbf{v}}_i = \sum_{i=1}^r \sigma_i \mathbf{u}_i \mathbf{v}_i^* = \mathbf{U} \mathbf{\Sigma} \mathbf{V}^*$ In the matrix case:  $\mathbf{d}_{i\mathbf{u}} (\mathcal{U}) = \mathbf{r} = \mathbf{d}_{i\mathbf{u}} (V)$ 

$$V = \text{Im}(\mathbf{A}) \text{ and } U = \mathbb{R}^m / \text{ker}(\mathbf{A})$$

 $\rightarrow$  their dimension **always** coincide!

How do we generalize this to tensors  $\mathbf{A} \in \mathbb{R}^{n_1 \times \ldots \times n_d}$ ?

- Find minimal subspaces s.t. **A** is an element of the induced tensor space
- The dimensions of these subspaces may not be equal

How do we generalize this to tensors  $\mathbf{A} \in \mathbb{R}^{n} \times ... \times n$ ?

- Find minimal subspaces s.t. **A** is an element of the induced tensor space
- The dimensions of these subspaces may not be equal

Let  $\{U_k\}_{k=1}^d$  be a collection of subsets with  $U_k \subseteq \mathbb{R}^{n_k}$ .

$$^{1}\dim(U_{k}) = r_{k}$$

How do we generalize this to tensors  $\mathbf{A} \in \mathbb{R}^{n_1 \times \ldots \times n_d}$ ?

- Find minimal subspaces s.t. **A** is an element of the induced tensor space
- The dimensions of these subspaces may not be equal

Let  $\{U_k\}_{k=1}^d$  be a collection of subsets with  $U_k \subseteq \mathbb{R}^{n_k}$ . For each subspace  $U_k$  we have an orthonormal basis<sup>1</sup>  $\{\mathbf{u}_{k,i}\}_{i=1}^{r_k}$ A tensor  $\mathbf{A} \in \bigotimes_{k=1}^d U_k$  can then be expressed as

$$\mathbf{A} = \sum_{i_1=1}^{r_1} \cdots \sum_{i_d=1}^{r_d} \mathbf{C}[i_1, ..., i_d] \cdot \mathbf{u}_{1, i_1} \otimes \mathbf{u}_{2, i_2} \otimes \cdots \otimes \mathbf{u}_{d, i_1}$$

$$^{1}\dim(U_{k}) = r_{k}$$

How do we generalize this to tensors  $\mathbf{A} \in \mathbb{R}^{n_1 \times \ldots \times n_d}$ ?

- Find minimal subspaces s.t. **A** is an element of the induced tensor space
- The dimensions of these subspaces may not be equal

Let  $\{U_k\}_{k=1}^d$  be a collection of subsets with  $U_k \subseteq \mathbb{R}^{n_k}$ . For each subspace  $U_k$  we have an orthonormal basis<sup>1</sup>  $\{\mathbf{u}_{k,i}\}_{i=1}^{r_k}$ A tensor  $\mathbf{A} \in \bigotimes_{k=1}^d U_k$  can then be expressed as

$$\mathbf{A} = \sum_{i_1=1}^{r_1} \cdots \sum_{i_d=1}^{r_d} \mathbf{C}[i_1, ..., i_d] \cdot \mathbf{u}_{1, i_1} \otimes \mathbf{u}_{2, i_2} \otimes \cdots \otimes \mathbf{u}_{d, i_1}$$

 $\Rightarrow \mathbf{C} \in \mathbb{R}^{r_1 \times \ldots \times r_d}$ , called the *core tensor* 

 $^{1}\dim(U_k) = r_k$ 

We may interpret

$$\mathbf{U}_k = [\mathbf{u}_{k,1}|...|\mathbf{u}_{k,r_k}]^\top \in \mathbb{R}^{r_k \times n_k}$$

with elements

$$\mathbf{U}_k[i_k, j] = \mathbf{u}_{k, i_k}[j]$$
 for  $1 \le i_k \le r_k$  and  $1 \le j \le n_k$ 

We may interpret

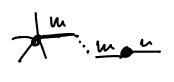

$$\mathbf{U}_k = [\mathbf{u}_{k,1}|...|\mathbf{u}_{k,r_k}]^\top \in \mathbb{R}^{r_k \times n_k}$$

with elements

$$\mathbf{U}_k[i_k, j] = \mathbf{u}_{k, i_k}[j]$$
 for  $1 \le i_k \le r_k$  and  $1 \le j \le n_k$ 

Then

$$\mathbf{A} = \mathbf{C} \ast_1 \mathbf{U}_1 \ast_2 \mathbf{U}_2 \dots \ast_d \mathbf{U}_d$$

Then  $\mathbf{A} = \mathbf{C} *_1 \mathbf{U}_1 *_2 \mathbf{U}_2 \dots *_d \mathbf{U}_d$ where  $*_k$  is the *k*th mode contraction of  $\mathbf{C}$  with  $\mathbf{U}_k$ .

We may interpret

$$\mathbf{U}_k = [\mathbf{u}_{k,1}|...|\mathbf{u}_{k,r_k}]^\top \in \mathbb{R}^{r_k \times n_k}$$

with elements

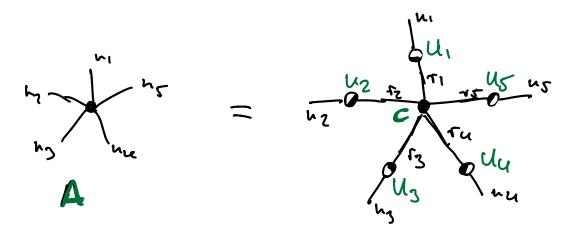

$$\mathbf{U}_k[i_k, j] = \mathbf{u}_{k, i_k}[j] \quad \text{for } 1 \le i_k \le r_k \text{ and } 1 \le j \le n_k$$

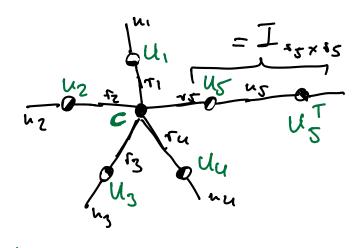

Then

$$\mathbf{A} = \mathbf{C} *_1 \mathbf{U}_1 *_2 \mathbf{U}_2 \dots *_d \mathbf{U}_d$$

where  $*_k$  is the *k*th mode contraction of **C** with  $\mathbf{U}_k$ . Elementwise:

$$\mathbf{A}[j_1, ..., j_d] = \sum_{i_1, ..., i_d} \mathbf{C}[i_1, ..., i_d] \mathbf{U}_1[i_1, j_1] \cdot \mathbf{U}_2[i_2, j_2] \cdots \mathbf{U}_d[i_d, j_d]$$

A

#### Tucker rank

Given a Tucker decomposition

$$\mathbf{A} = \sum_{i_1=1}^{r_1} \cdots \sum_{i_d=1}^{r_d} \mathbf{C}[i_1, ..., i_d] \cdot \mathbf{u}_{1, i_1} \otimes \mathbf{u}_{2, i_2} \otimes \cdots \otimes \mathbf{u}_{d, i_1}$$

We call the tuple

$$\mathbf{r} = (r_1, r_2, \dots, r_d)$$

the rank of the associated decomposition.

The *Tucker rank* (T-rank)  $\mathbf{r}$  is the minimal *d*-tuple such that there exists a Tucker representation of  $\mathbf{A}$ .

What does minimal mean?

#### Tucker rank

Given a Tucker decomposition

$$\mathbf{A} = \sum_{i_1=1}^{r_1} \cdots \sum_{i_d=1}^{r_d} \mathbf{C}[i_1, ..., i_d] \cdot \mathbf{u}_{1, i_1} \otimes \mathbf{u}_{2, i_2} \otimes \cdots \otimes \mathbf{u}_{d, i_1}$$

We call the tuple

$$\mathbf{r} = (r_1, r_2, \dots, r_d)$$

the rank of the associated decomposition.

The *Tucker rank* (T-rank)  $\mathbf{r}$  is the minimal *d*-tuple such that there exists a Tucker representation of  $\mathbf{A}$ .

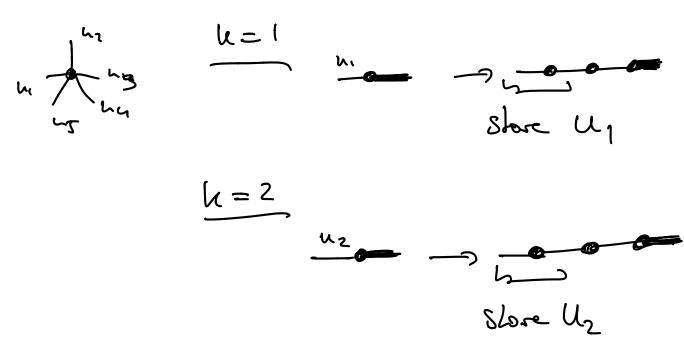

What does minimal mean? Partial order of *d*-tuples: On the set of *d*-tuples we define the partial order  $\preccurlyeq$  as

$$(x_1, ..., x_d) = \mathbf{x} \preccurlyeq \mathbf{y} = (y_1, ..., y_d) \quad \Leftrightarrow \quad x_i \le y_i \quad \forall i$$

- Looks a bit more complicated than CP decomposition
  - $\rightarrow$  How to find the subspaces?
  - $\rightarrow$  Rank definition aligns less with what we know from matrices!
- Can be computed constructively  $\rightarrow$  higher-order SVD (HOSVD)
- Tensors of bounded or fixed Tucker rank are much nicer  $\rightarrow$  Manifold structure  $\rightarrow$  Closed set

Algorithm:

Input: Target tensor A Output: Core tensor **C**, basis matrices  $\mathbf{U}_k \in \mathbb{R}^{r_k \times n_k}$  for  $1 \leq k \leq d$ Calculate  $\tilde{\mathbf{U}}_k \boldsymbol{\Sigma}_k \mathbf{V}^* = \text{SVD}(\mathbf{A}^{(k)})$ for k = 1 : d[Recall notation:  $\mathbf{A}^{(k)}$  was the k-mode matricization]  $\mathbf{U}_k = \tilde{\mathbf{U}}_k^\top$ Calculate  $\mathbf{C} = \mathbf{A} *_1 \mathbf{U}_1^\top *_2 \mathbf{U}_2^\top \dots *_d \mathbf{U}_d^\top$  $= A \neq U_1 \neq U_2 \neq U_2 \neq U_4 \qquad T$ 

## high-order SVD

The HOSVD yields Tucker decomposition of minimal rank:

Theorem

Given a tensor  $\mathbf{A} \in \mathbb{R}^{n_1 \times \ldots \times n_d}$ , let  $\mathbf{C} \in \mathbb{R}^{r_1 \times \ldots \times r_d}$  and  $\mathbf{U}_k \in \mathbb{R}^{r_k \times n_k}$  for  $1 \leq k \leq d$  be the core and basis matrices obtained with the HOSVD. Then

$$\mathbf{A} = \mathbf{C} *_1 \mathbf{U}_1 *_2 \mathbf{U}_2 \dots *_d \mathbf{U}_d$$

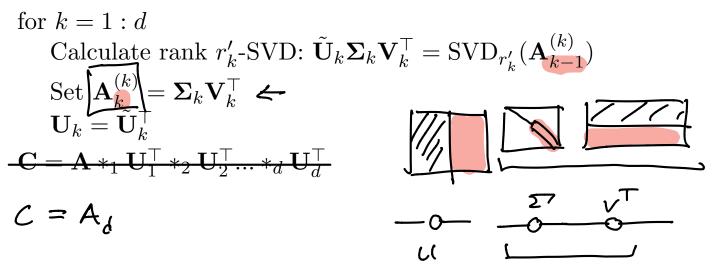

is a Tucker representation of  $\mathbf{A}$  of minimal rank. The obtained representation rank is also the Tucker rank of  $\mathbf{A}$ , is related to the matrix rank of the *k*th mode matricizations via

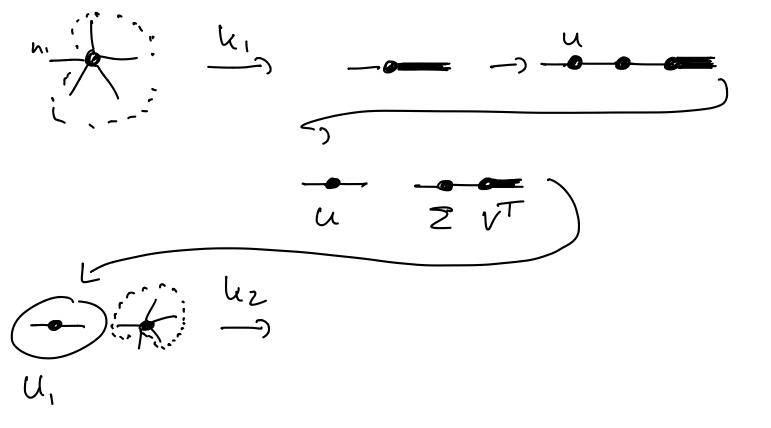

$$\operatorname{T-rank}(\mathbf{A}) = \left(\operatorname{rank}(\mathbf{A}^{(1)}), \operatorname{rank}(\mathbf{A}^{(2)}), \dots, \operatorname{rank}(\mathbf{A}^{(d)})\right)$$

## Low T-rank approximation

Ee can adjust the HOSVD to get a T-rank approximation of  $\mathbf{A}$  of rank  $\mathbf{r'}$ Input: Target tensor  $\mathbf{A}$ 

Output: Core tensor  $\mathbf{C}$ , basis matrices  $\mathbf{U}_k \in \mathbb{R}^{r_k \times n_k}$  for  $1 \le k \le d$ Set  $\mathbf{A}_0 = \mathbf{A}$ 

#### Quasi Best Approximation

There is no Eckart-Young theorem for low T-rank approximations!

Theorem:

Given a tensor  $\mathbf{A} \in \mathbb{R}^{n_1 \times \ldots \times n_d}$ , let  $\mathbf{C} \in \mathbb{R}^{r_1 \times \ldots \times r_d}$  and  $\mathbf{U}_k \in \mathbb{R}^{r_k \times n_k}$  for  $1 \leq k \leq d$  be the core and basis matrices obtained with the rank  $\mathbf{r}'$ -truncated HOSVD. These define a rank  $\mathbf{r}'$  Tucker approximation

$$\mathbf{A}' = \mathbf{C} *_1 \mathbf{U}_1 *_2 \mathbf{U}_2 \dots *_d \mathbf{U}_d.$$

The tensor  $\mathbf{A}'$  is a quasi-best rank  $\mathbf{r}'$  approximation to  $\mathbf{A}$ , i.e.,

$$\|\mathbf{A} - \mathbf{A}'\|_F \le \sqrt{d} \min\left\{\|\mathbf{A} - \mathbf{Y}\|_F \mid \mathbf{Y} \in \mathbb{R}^{n_1 \times \dots \times n_d}, \text{ T-rank}(\mathbf{Y}) \preccurlyeq \mathbf{r}'\right\}$$

## The Tucker manifold

Theorem [Tucker manifold]: The set

$$\mathcal{M}_r^{\mathrm{T}} = \left\{ \mathbf{X} \in \mathbb{R}^{n_1 \times \ldots \times n_d} \mid \text{T-rank}(\mathbf{X}) = r \right\}$$

admits a manifold structure<sup>2</sup>.

<sup>&</sup>lt;sup>2</sup>Uschmajew & Vandereycken. Linear Algebra and its Applications (2013)

## The Tucker manifold

Theorem [Tucker manifold]: The set

$$\mathcal{M}_r^{\mathrm{T}} = \left\{ \mathbf{X} \in \mathbb{R}^{n_1 \times \ldots \times n_d} \mid \text{ T-rank}(\mathbf{X}) = r \right\}$$

admits a manifold structure<sup>2</sup>.

Proposition:

The set

$$\mathcal{M}_{\preccurlyeq r}^{\mathrm{T}} = \left\{ \mathbf{X} \in \mathbb{R}^{n_1 \times \ldots \times n_d} \mid \text{T-rank}(\mathbf{X}) \preccurlyeq r \right\}$$

is closed.

<sup>&</sup>lt;sup>2</sup>Uschmajew & Vandereycken. Linear Algebra and its Applications (2013)

Storage of Tucker decomposition

$$A = \mathcal{A} \ast_{1} \mathcal{U}_{1} \ast_{2} \mathcal{U}_{2} \ldots \ast_{d} \mathcal{U}_{d}$$

We store:

- the core tensor  $\mathbf{C} \in \mathbb{R}^{r_1 \times \ldots \times r_d}$
- the basis matrices  $\mathbf{U}_k \in \mathbb{R}^{r_k \times n_k}$  for  $1 \le k \le d$

This scales as

$$\mathcal{O}(r^d + dnr)$$

where  $r = \max_i(r_i)$  and  $n = \max_i(n_i)$ 

Note that for  $r \ll n$  this is a significant reduction over  $\mathcal{O}(n^d)$ 

$$A = \sum_{\substack{p=1\\j=1}}^{r} \bigotimes_{i=1}^{d} \vartheta_{i,p} \qquad G(rud)$$

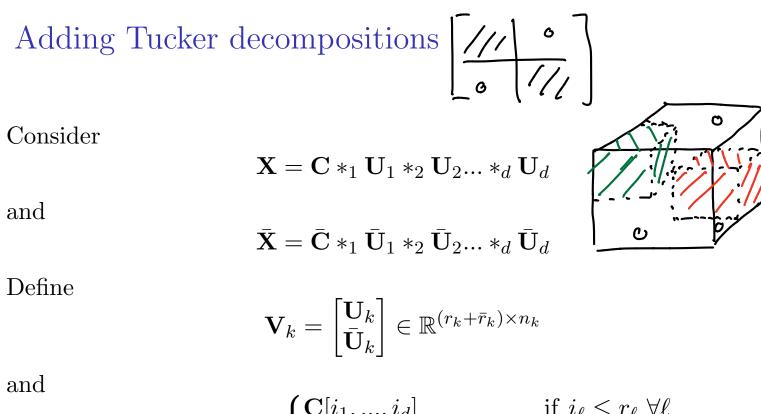

## Accessing entries

One has to compute

$$\mathbf{A}[j_1, ..., j_d] = (\mathbf{C} *_1 \mathbf{U}_1 *_2 \mathbf{U}_2 ... *_d \mathbf{U}_d) [j_1, ..., j_d]$$
  
=  $\sum_{i_1=1}^{r_1} ... \sum_{i_d=1}^{r_d} \mathbf{C}[i_1, ..., i_d] \mathbf{U}_1[i_1, j_1] \mathbf{U}_2[i_2, j_2] ... \mathbf{U}_d[i_d, j_d]$ 

set  $r = \max_i(r_i)$ .

- Per for-loop we have  $\mathcal{O}(r)$  operations
- For d nested for-loops this yields:  $\mathcal{O}(r^d)$
- Recall:  $\mathcal{O}(dr)$  for CP-decomposition

$$\mathbf{D}[i_1, \dots, i_d] = \begin{cases} \mathbf{C}[i_1, \dots, i_d] & \text{if } i_\ell \le r_\ell \ \forall \ell \\ \bar{\mathbf{C}}[i_1 - r_1, \dots, i_d - r_d] & \text{if } i_\ell > r_\ell \ \forall \ell \\ 0 & \text{else} \end{cases}$$

## Adding Tucker decompositions Then

$$\begin{aligned} (\mathbf{X} + \bar{\mathbf{X}})[j_1, ..., j_d] &= \sum_{i_1=1}^{r_1} \dots \sum_{i_d=1}^{r_d} \mathbf{C}[i_1, ..., i_d] \mathbf{U}_1[i_1, j_1] \cdots \mathbf{U}_d[i_d, j_d] \\ &+ \sum_{i_1=1}^{\bar{r}_1} \dots \sum_{i_d=1}^{\bar{r}_d} \bar{\mathbf{C}}[i_1, ..., i_d] \bar{\mathbf{U}}_1[i_1, j_1] \cdots \bar{\mathbf{U}}_d[i_d, j_d] \\ &= \sum_{i_1=1}^{r_1 + \bar{r}_1} \dots \sum_{i_d=1}^{r_d + \bar{r}_d} \mathbf{D}[i_1, ..., i_d] \mathbf{V}_1[i_1, j_1] \cdots \mathbf{V}_d[i_d, j_d] \end{aligned}$$

Setting  $r = \max_i(r_i)$  and  $\bar{r} = \max_i(\bar{r}_i)$ The storage scales as

$$\mathcal{O}\left((r+\bar{r})^d + dn(r+\bar{r})\right)$$

and evaluating elements scales

$$\mathcal{O}\left((r+\bar{r})^d\right)$$
